

# The 2% solution to fight global warming

Plan 001 Clean up the Pacific Ocean

The question of how to fight global warming with limited resources is for the world's citizens to agree to redeploy resources that are under performing for them.

The proposal here is to take 2% of the budget for the world's navies and send an armada to the pacific to clean it up.

This is a naval military operation. If all countries did that would any individual country be less safe?

Would the cleanup of the Pacific actually protect the citizens of each country from pollution, plastic in the food that comes from the ocean, and provide purpose for their navy and safety of the citizens?

Here is a map and article of the pacific waste/pollution problem.

<https://www.forbes.com/sites/trevornace/2018/09/10/the-worlds-largest-ocean-cleanup-has-officially-begun/>

Now this type of equipment should be used by every navy in a small version to be deployed locally when environmental accidents happen. By cohesively acting with all navies all of get:

-Our navy equipment with the best methods and technology to combat pollution.

-Trained to act cohesively with a large flotilla sent to combat a global disaster

That means where President Trump has stopped Naval operations near the Korean peninsula that joint exercise with the South Koreans and any other participating military partners regionally (Australia, Japan?) it can now redeploy those resources to this effort.

There will be more on how to develop this plan going forward and as always contributions from scientists engineers and designers as well as military contractors are welcome.
